

— WORKING GROUP WALKTHROUGH · MEETING #012

The v0.3.0 rate plan model, carried through the vocabulary

How fragmented publications resolve into one readable snapshot of a rate plan.

DATE

2026-07-14 · 11:30 ET

STATUS

v0.3.0 candidate, for review

VALIDATED AGAINST

ConEd SC1 Rate I worked example

No single published artifact carries a whole rate plan

The released model assumed a version was one complete snapshot that carried all of its own prices. Real publications do not work that way. The pieces arrive separately, on different cycles, from different documents.

- A **tariff book leaf** publishes only one section's delivery charges.
- A **monthly statement** publishes only one adjustment charge.
- Supply charges arrive through a **market price feed**, on their own cycle, outside the tariff book entirely.

The risk of pretending otherwise: every implementer invents their own way to stitch the sources together, and two conformant implementations stitch them differently.

The RatePlan is pure identity. Content lives on its **derived** version.

The **RatePlan** itself holds no pricing content. Content still lives on a version. That version, the **RatePlanVersion** (or **RatePlanModifierVersion**), is now a resolved snapshot that reconciliation materialises from the pricing models referencing the plan. Previously it was an authored artifact the plan owned.

Four layers, from published source to resolved snapshot

1 · PUBLISHED SOURCES

SOURCEPUBLICATION
tariff book

SOURCEPUBLICATION
statement

SOURCEPUBLICATION
market price feed

2 · AUTHORED CONTENT

TARIFF FILING →

PricingModel

price definitions + plan elements ·
may be partial

PricingModel

market feed · no filing

→ **documentedBy** → **source**

3 · IDENTITY

STABLE

RatePlan

+ RatePlanIdentifier(s)

→ **referencesRatePlan**

→ **or applicability**

4 · DERIVED

BY RECONCILIATION

RatePlanVersion

resolved snapshot for a window

CoverageClaim

complete? self-contained?

→ **forRatePlan**

What a consumer reads is the **resolved snapshot**. It materialises the prices from every pricing model applicable to the plan in that window, and states how complete it is.

Nine terms carry the model

PricingModel

The authored, citable unit of published pricing.
May cover part of a plan.

TariffFiling

The regulatory wrapper a pricing model publishes in. Carries effective dates and lifecycle.

SourcePublication

The published artifact itself: a tariff book, statement, or market price feed.

SourceReference

A citation from content to the exact place in a source (file, page, retrieval date).

RatePlanIdentifier

A typed, URI-addressable id (utility code, CA MIDAS RIN) with a scheme.

CoverageClaim

The required honesty stamp: complete or partial, self-contained or externally priced.

Evaluation

The recorded rationale behind a coverage claim.

ModelCollection

A thread grouping successive pricing models from the same source.

PriceDefinitionReference

The pointer a snapshot uses for components priced elsewhere.

Five shifts from the released model

- **RatePlanVersion keeps its name, with a new meaning.** It is now the derived, resolved snapshot: produced by reconciliation, consumed by readers. It gains **forRatePlan**, a required **hasCoverageClaim**, and **selfContained**.
- **Direction of reference inverted.** A pricing model declares **referencesRatePlan**; generic market packages declare none and are reached by applicability.
- **Lifecycle lives on the filing.** Supersession, cancellation, and effective dating attach to **TariffFiling**, the regulatory event, rather than to the snapshot.
- **Source citation is uniform.** **DataSourceReference** becomes **SourceReference**; every model can state **documentedBy** and **pursuantTo**.
- **Confidence is explicit.** A model carries **confidence** (verified · estimated · projected); a snapshot blends its inputs and reports the result.

One class replaces a class per document type

Three fragmented sources resolve into one snapshot

TARIFF BOOK LEAF

delivery charges

customer charge + 2 energy prices · referencesRatePlan

5 MONTHLY STATEMENTS

adjustment charge

condition: applies to all classes except SC 11 · each supersedes the last

MARKET PRICE FEED (CSV)

supply charge

13 monthly windows · no filing, applicability only

RECONCILIATION

RATEPLANVERSION

effective 2026-02-01

✓ complete · self-contained

Every file validates against the candidate shapes, and the snapshot validates entirely on its own.

Self-contained, with dates on the facts

Self-contained, provenance preserved

A snapshot assumes the sources cannot be reached, so it carries price definitions, ledgers, metric definitions, conditions, and citations in full, keeping the URI each node was published under. A consumer needs only the one file. Anyone who does hold the sources can still walk the shared URIs back to them.

Facts keep their own dates

The market supply price covering the effective date started earlier, on 2025-12-31, and ends on its own cycle. The snapshot does not clip it. Validity lives on the fact rather than the envelope.

Three vocabulary items queued for a follow-up set

- **Filing-level cancellation.** `cancelPriceDefinition`, so a filing can retire a price definition without mutating it.
- **Component validity dates.** Effective and expiration dates on plan-element components (time-of-use schedules, seasons), for snapshots that blend a mid-window structural change.
- **Confidence on the coverage claim.** First-class placement of the derived confidence value, currently recorded in the claim's evaluation text.

A few closed shapes are also missing properties the ontology permits. These are catalogued for the next shape-alignment batch, and none affect the worked examples.

Three checks, and one decision

- 1 Does the model, as carried through the vocabulary, **match the direction** agreed at the last two meetings?
- 2 Does the worked example set **cover your publication patterns**? If one is missing, such as bundled supply contracts, rider stacking, or net-metering credits, name it, and the same five-part exercise runs against it.
- 3 **The one decision:** the re-meaning of **RatePlanVersion** is the single change to an already-published class. We ask for **explicit assent** before the release and license transition move forward.
